

ABSTRACT

The present invention concerns a lining support
5 comprising a plurality of conductive pads (12)
associated with a shared addressing contact (18) and
means of selecting at least one pad to be lined by
electrochemical means among the plurality of pads. In
accordance with the invention, the selection means
10 comprise means (20) of shifting a polarisation voltage,
connected between the shared addressing contact and at
least one pad to be addressed.

Application to the lining of conductive pads.
